Dear HEAL Palestine Hiring Team,

I am writing to express my strong interest in the Structural Engineer position in Gaza. As a civil and structural engineer with over 7 years of diverse field experience in Gaza — spanning infrastructure construction, shelter rehabilitation, GIS mapping, and humanitarian project implementation — I am confident that my technical background and deep local knowledge make me a strong fit for this role.

I hold a Bachelor's degree in Civil Engineering from the Islamic University of Gaza, and my career has been built entirely in the field, working under some of the most challenging conditions imaginable. During my time as a Civil Engineer with UNRWA's Infrastructure and Camp Improvements Programme (303 working days), I supervised rubble removal operations, rehabilitated damaged structures, and managed camp infrastructure works across Gaza. My later role as GIS Expert and Site Engineer at the Ministry of Interior (2013–2016) further strengthened my ability to combine technical engineering assessment with spatial data analysis — a combination that is directly relevant to damage evaluation and field structural assessments.

I understand that structural engineering in Gaza today demands far more than technical knowledge — it requires sound judgment under pressure, ethical integrity, and practical problem-solving with limited resources. When assessing a damaged structure, I follow a systematic approach: evaluating load-bearing elements, inspecting slabs and connections for signs of failure, and assessing foundation stability before making any safety classification. When standard materials are unavailable, I adapt — using timber shoring, rubble masonry, and compacted earth fills to stabilize structures temporarily while prioritizing occupant safety above all else.

I am committed to professional integrity even when faced with community pressure. In situations where a structure must be classified as unsafe, I believe the engineer's role is not only to deliver an honest assessment but to immediately propose practical alternatives — whether a nearby safe building, temporary shelter, or a phased repair plan. When a case exceeds the scope of field assessment, I do not hesitate to refer it to the higher technical committee for further evaluation and decision-making.

I am deeply motivated by HEAL Palestine's mission and by the urgent need for qualified structural engineers who can contribute to rebuilding Gaza's communities safely and sustainably. I would welcome the opportunity to bring my skills, experience, and commitment to your team.

Thank you for considering my application.

Sincerely,

Mohammed Zobeidah
